

1886060 - System Monitoring Setup for SAP Router

Component: SV-SMG-MON-ALR (Service > SAP Solution Manager > Monitoring & Alerting > Monitoring/Alerting/Reporting Infrastructure), Version: 10, Released On: 28.02.2023

Symptom

The note describes how to setup System Monitoring for SAP Router system in SAP Solution Manager 7.2 and SAP Focused Run

Other Terms

SAP Focused Run, SAP Solution Manager, technical monitoring, alerting, system monitoring, managed system setup, simple system integration, open component monitoring, health monitoring

Solution

SAP Solution Manager 7.2 (or higher)

SAP Solution Manager supports SAP Router with System Monitoring. The note describes how to setup and configure System Monitoring in the SAP Solution Manager 7.2 for SAP Router.

- SAP Router 6.20 – 7.43 are supported with System Monitoring as of the SAP Solution Manager 7.2 SP3.
- SAP Router 7.49 – 7.73 are supported with the latest content updates as of SAP Solution Manager 7.2 SP 7.

Perform following steps to setup system Monitoring for SAP Router system:

Install Diagnostics agent.

- Setup a customer script with NIPING to be used with Remote OS Command Collector to check SAP Router availability.
- Register the SAP Router as a Unspecific Standalone Application system in SAP Solution Manager.
- Run Managed System Setup for the SAP Router system.
- Run Technical Monitoring Setup for SAP Router system.

Refer to the attached SolMan_SAPRouter_Monitoring.pdf document for more details.

NOTE: in Section "2.2 Configure the custom script with the Remote OS Console" ignore the following: "3. Test the SAP Router availability script with the Remote OS Console"

SAP Focused Run 2.0 (or higher)

All SAP Router versions can be monitored with SAP Focused Run 2.0 or higher. Due to the unmodelled approach no version dependency exists.

Perform following steps to setup Health Monitoring (Open Component Monitoring) for SAP Router system:

- Install SAP Host Agent
- Configure Outside Discovery (a Simple Diagnostics Agent is automatically deployed on this host as result of the Outside Discovery)
- Register a new custom operation `ocm_saprouter` in SAP Host Agent by creating a new file `ocm_saprouter.conf` in the directory `/usr/sap/hostctrl/exe/operations.d` as user root. Put the following content into this file (Note `<sidadm>` needs to be replaced with the OS user used to start SAP Router):
 Command: `niping -c ${HOSTNAME:-H #required} ${PORT:-S #required} -O -X 1`
 Username: `<sidadm>` for a Unix host, `<User under whom Host Agent runs>` for a windows host
 Description: Unix Name
 ResultConverter: flat
 Mode: Sync

- In order to be authorized to create an OS Script Metric in Health Monitoring (Open Component Monitoring) you have to include the script name into the corresponding pfcg role.
For example you copied the SAP-delivered pfcg role SAP_FRN_AAD_AVM_ALL which contains the administer authorization for Health Monitoring (Open Component Monitoring) to a customer specific pfcg role <a>.
Go to ‘Role Maintenance’ (transaction pfcg) and enter role <a>. Then click on ‘Change’-button and then click on tab ‘Authorizations’.
Then maintain script name in field ‘CUSTOM_OPE’ of authorization object FRN_CUSTOP.
- Create a new OS Script result metric in Health Monitoring (Open Component Monitoring) with the following parameters:
 - Metric Name: SAPRouter Availability
 - Metric Type: "OS Script Result"
 - Script Name: ocm_saprouter
 - Parameters: HOSTNAME:<SAPRouter FQDN>,PORT:<Port under whom Host Agent runs e. g. 3298>
 - Collection Group: Customer Network where SAPRouter is running
 - Host: SDA Agent Hostname, where SAPRouter is running
 - Threshold: Already Rated, Maximum Value

Attributes

Key	Value
Other Components	Service > Focused Run (FRUN) > FRUN: Applications > FRUN: System Monitoring (SysMon) (SV-FRN-APP-SYM)
Other Components	Service > SAP Solution Manager > Monitoring & Alerting > System Monitoring (SV-SMG-MON-SYS)
